Recap: FO Resolution

- Substitution Lemma: Given an interpretation *F* = ((M, ι), σ), an expression φ ∈ FO_Σ, and a substitution {u/x} such that u^F = m ∈ M, *F* ⊨ φ{u/x} iff *F*[x ↦ m] ⊨ φ.
- Let δ_1, δ_2 be clauses s.t. $fv(\delta_1) \cap fv(\delta_2) = \emptyset$
- Let $P \in \mathcal{P}$ be a k-ary predicate symbol
- Let $L_1 = \{ P(u_1, \dots, u_k) \in \delta_1 \mid u_1, \dots, u_k \in T(\Sigma) \}$ such that $\delta_1 = \delta'_1 \cup L_1$
- Let $L_2 = \{ \neg P(\nu_1, \dots, \nu_k) \in \delta_2 \mid \nu_1, \dots, \nu_k \in T(\Sigma) \}$ such that $\delta_2 = \delta'_2 \cup L_2$
- Denote by \overline{L}_2 the set { $P(v_1, ..., v_k) \in \delta_2 \mid v_1, ..., v_k \in T(\Sigma)$ }
- Let $L_1 \cup \overline{L}_2$ be unifiable, with θ an mgu

$$\frac{\delta_1' \cup L_1 \qquad \delta_2' \cup L_2}{\theta(\delta_1' \cup \delta_2')} \theta$$

Towards a proof system

- The resolution procedure (linking unsatisfiability to the derivation of an empty clause) is sound and complete
- However, this rule does not provide a complete proof system for first-order logic (**Exercise**: Think about why!)
- Move to a less minimal proof system (which might be complete)
- {¬, ⊃, ∀} is a functionally complete set of operators for FOL
- Can extend $\vdash_{\mathscr{H}}$ to get \vdash_{HK} for FOL
- All FO expression instances of PL tautologies are valid
- A **generalization** of an expression φ is any $\forall x_1 \dots x_n$. φ , where $n \ge 0$. FO syntax: $\varphi, \psi, \chi \coloneqq t_1 \equiv t_2 | P(t_1, \dots, t_n) | \neg \psi | \psi \supset \chi | \forall x$. $[\psi]$

System \vdash_{HK} for FO

All generalizations of the following, along with MP.

(H1a) $\phi \supset (\psi \supset \phi)$ (H1b) $(\varphi \supset (\psi \supset \chi)) \supset ((\varphi \supset \psi) \supset (\varphi \supset \chi))$ (H1c) $(\neg \phi \supset \neg \psi) \supset ((\neg \phi \supset \psi) \supset \phi)$ (H2a) $x \equiv x$ **(H2b)** $x \equiv y \supset ((\varphi(x) \supset \varphi(y)) \land (\varphi(y) \supset \varphi(x)))$ **(H3a)** $\forall x. [\phi \supset \psi] \supset (\forall x. [\phi] \supset \forall x. [\psi])$ **(H3b)** $\varphi \supset \forall x$. $[\varphi]$ where x does not appear free in φ (H₃c) $\forall x. [\phi] \supset \phi\{t/x\}$ for any term t $\frac{\phi \supset \psi \quad \phi}{MP}$ We denote provability in this system with

ψ

Soundness of \vdash_{HK}

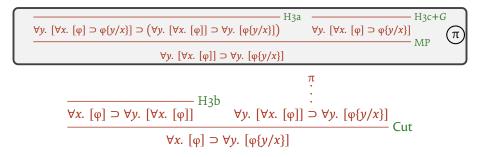

- **Theorem (Soundness)**: If $\vdash_{HK} \varphi$, then $\models \varphi$
- Show that axioms are valid, and that MP preserves validity
- Might need the following lemma: For every φ, every x ∈ V, and every y ∉ vars(∀x. [φ]),

 $\models (\forall x. \ [\phi] \supset \forall y. \ [\phi\{y/x\}]) \land (\forall y. \ [\phi\{y/x\}] \supset \forall x. \ [\phi]).$

- For all Γ , α , β , we have the following
- **Deduction Theorem**: Γ , $\alpha \vdash_{HK} \beta$ iff $\Gamma \vdash_{HK} \alpha \supset \beta$.
- **Cut** is admissible: If $\Gamma \vdash \alpha$ and $\Gamma, \alpha \vdash \beta$, then $\Gamma \vdash \beta$.
- **Lemma (Replacement by new variables)**: Suppose $\Gamma \vdash_{HK} \varphi$, and $y \in \mathcal{V} \setminus (vars(\Gamma) \cup vars(\varphi))$. Then, $\Gamma\{y/x\} \vdash_{HK} \varphi\{y/x\}$.
- **Exercise**: Prove all these statements.

Substituting bound variables: Equivalence

Lemma: For every φ , every $x \in \mathcal{V}$, and every $y \notin vars(\forall x. [\varphi])$, $\vdash_{HK} (\forall x. [\varphi] \supset \forall y. [\varphi\{y/x\}]) \land (\forall y. [\varphi\{y/x\}] \supset \forall x. [\varphi]).$ **Proof**: Enough to show (\Rightarrow), i.e. $\vdash_{HK} \forall x. [\varphi] \supset \forall y. [\varphi\{y/x\}].$ (\Leftarrow) follows since $x \notin vars(\forall y. [\varphi\{y/x\}])$, and $\varphi\{y/x\}\{x/y\} = \varphi$.

Universal generalization lemma

Lemma (Universal generalization): Suppose $\Gamma \vdash_{HK} \varphi\{y/x\}$, where $y \notin fv(\Gamma) \cup fv(\varphi)$. Then, $\Gamma \vdash_{HK} \forall x$. $[\varphi]$.

Proof: Suppose Γ $\vdash_{HK} \varphi(y/x)$ via a proof π. We first show the following:

For any sequent $\Gamma \vdash_{HK} \alpha_i$ appearing in the proof π , $\Gamma \vdash_{HK} \forall y$. $[\alpha_i]$.

(Then, $\Gamma \vdash_{HK} \forall y$. $[\varphi\{y/x\}]$, and by the previous lemma, $\Gamma \vdash_{HK} \forall x$. $[\varphi]$.) The proof is by induction on the structure of π .

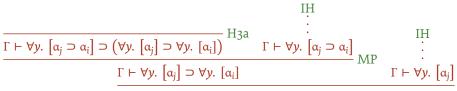

Base case(s): Suppose α_i is an instance of an axiom. Then, $\forall x$. $[\alpha_i]$ is a generalization of an axiom, and hence, also an axiom. Otherwise, suppose $\alpha_i \in \Gamma$. Then, $y \notin fv(\alpha_i)$. Thus, **(H3b)** gives us $\alpha_i \supset \forall y$. $[\alpha_i]$.

$$\frac{\Gamma \vdash \alpha_i \supset \forall y. \ [\alpha_i]}{\Gamma \vdash \forall y. \ [\alpha_i]} \xrightarrow{\Gamma \vdash \alpha_i} Ax$$

$$MP$$

Universal generalization lemma: Proof

Induction case: α_i is obtained by applying MP to some $\alpha_j \supset \alpha_i$ and α_j , both appearing in shorter subtrees. By IH, $\Gamma \vdash \forall y$. $[\alpha_j \supset \alpha_i]$ and $\Gamma \vdash \forall y$. $[\alpha_j]$.

 $\Gamma \vdash \forall y. [\alpha_i]$

Completeness of \vdash_{HK}

- Gödel's Completeness Theorem (1929): If $\Gamma \models \varphi$, then $\Gamma \vdash_{HK} \varphi$
- Want a slightly different, equivalent formulation of this statement
- Introduce a notion of **consistency**
- An expression φ is said to be **consistent** if $\forall_{HK} \neg \varphi$
- A finite set $\{\varphi_1, ..., \varphi_n\}$ is consistent if $\bigwedge_{1 \leq i \leq n} \varphi_i$ is consistent
- An arbitrary set Γ is consistent if each of its finite subsets is consistent.
- Equivalent statement: Any consistent set of expressions is satisfiable
- **Exercise**: Show that this is equivalent to the Completeness statement.

Completeness of \vdash_{HK}

- Suppose we start out with a consistent set of expressions Γ
- The proof becomes easier if we can assume $\mathcal{V} \setminus \text{vars}(\Gamma)$ to be infinite.
- We achieve this as follows. Let $\mathcal{V} = \{x_0, x_1, x_2, ...\}$
- Partition this set into $\mathcal{V}_e = \{x_0, x_2, x_4, ...\}$ and $\mathcal{V}_o = \{x_1, x_3, x_5, ...\}$
- Given a Γ, form Δ by systematically replacing each occurrence (free or bound) of x_i in Γ by x_{2i} for all i ≥ 0.
- $\operatorname{vars}(\Delta) \subseteq \mathcal{V}_e$, so $\mathcal{V} \setminus \operatorname{vars}(\Delta)$ is infinite.
- We now need to prove the following:
 - If Γ is consistent, then Δ is consistent
 - If Δ is satisfiable, then Γ is satisfiable
- Once we prove these, we can assume *V* \ vars(Γ) to be infinite in the rest of the presentation.

Γ consistent $\Rightarrow \Delta$ consistent

- Proof by contradiction. Suppose Δ is inconsistent.
- Then, there is a $\{\delta_1, \dots, \delta_k\} \subseteq_{\text{fin}} \Delta$ such that $\vdash_{HK} \neg (\delta_1 \land \dots \land \delta_k)$
- Let *n* be such that i < 2n for every *i* where $x_i \in fv(\bigcup_{1 \le j \le k} \delta_j)$.
- Replace every $x_{2j} \in vars(\bigcup_{1 \le j \le k} \delta_j)$ by x_{2n+j} to get $\{\rho_1, \dots, \rho_k\}$
- **Claim**: $\vdash_{HK} \neg (\rho_1 \land ... \land \rho_k)$ **Exercise**: Prove this claim.
- Replace every x_{2n+j} by x_j to get $\{\gamma_1, ..., \gamma_k\} \subseteq_{\text{fin}} \Gamma$
- $\vdash_{HK} \neg (\gamma_1 \land ... \land \gamma_k)$
- Thus, **Γ** is inconsistent.

Δ satisfiable $\Rightarrow \Gamma$ satisfiable

- Suppose $(\mathcal{M}, \sigma) \models \Delta$.
- Only variables from \mathcal{V}_{e} appear in Δ
- We replace every occurrence of x_{2i} by x_i to get Γ
- $(\mathcal{M}, \sigma') \models \Gamma$, where $\sigma'(x_i) = \sigma(x_{2i})$
- Thus, if Δ is satisfiable, then so is Γ

Lindenbaum's Lemma

- A set Γ is maximally consistent if Γ is consistent, and Γ ∪ {φ} is inconsistent for any FO expression φ ∉ Γ.
- A set Γ is said to be \exists -fulfilled iff for every expression of the form $\neg \forall x$. $[\alpha] \in \Gamma$, there exists some term *t* such that $\neg \alpha \{t/x\} \in \Gamma$.
- Lindenbaum's Lemma: Every consistent set can be extended to an -fulfilled MCS.
- Given a consistent Γ , we build an \exists -fulfilled MCS which extends Γ .
- As earlier, fix an enumeration of expressions, and examine each.

- Fix an enumeration $\varphi_0, \varphi_1, \varphi_2, ...$ of the expressions in FO_{Σ}
- Also fix an enumeration x_0, x_1, x_2, \dots of the variables in \mathcal{V}
- Now, we build the following sequence Γ_0 , Γ_1 , ... of sets of formulas.
- $\Gamma_0 \coloneqq \Gamma$, and for every $i \ge 0$,

 $\Gamma_{i+1} \coloneqq \begin{cases} \Gamma'_i & \text{if } \Gamma'_i \text{ consistent and } \varphi_i \text{ not of the form } \neg \forall x. \ [\alpha] \\ \Gamma'_i \cup \{\neg \alpha \{y/x\}\} & \text{if } \Gamma'_i \text{ consistent, } \varphi_i = \neg \forall x. \ [\alpha], \text{ and} \\ y \text{ the first variable not in } fv(\Gamma_i) \cup \text{vars}(\varphi_i)^1 \\ \Gamma_i & \text{if } \Gamma'_i \text{ not consistent} \end{cases}$

where $\Gamma'_i = \Gamma_i \cup \{\varphi_i\}.$ • Finally, $\Gamma_{\text{ext}} \coloneqq \bigcup_{i>0} \Gamma_i$

¹We can get away with only requiring that *y* is the first variable not in $fv(\Gamma_i) \cup fv(\alpha)$ as long as we somehow ensure that $y \notin bv(\alpha)$

- **Claim**: Γ_{ext} is maximally consistent and \exists -fulfilled.
- We first show that each Γ_i is consistent (by induction on i)
- **Base case**: $\Gamma_0 = \Gamma$, consistent by assumption.
- Induction step: Suppose Γ_i is consistent. Two cases arise: Either
 Γ'_i = Γ_i ∪ {φ_i} is consistent or not.
- In the latter case, $\Gamma_{i+1} = \Gamma_i$, and Γ_{i+1} is also consistent.
- If $\Gamma'_i = \Gamma_i \cup {\varphi_i}$ is consistent, and if φ_i is not of the form $\neg \forall x$. [α], then $\Gamma_{i+1} = \Gamma'_i$, so consistent by construction.

- If $\varphi_i = \neg \forall x$. [α] for some α , and $\Gamma_i \cup \{\neg \forall x, [\alpha]\}$ is consistent, we set $\Gamma_{i+1} = \Gamma_i \cup \{\neg \forall x, [\alpha], \neg \alpha \{y/x\}\}$, where *y* is the first variable not in fv(Γ_i) \cup vars(φ_i)
- Suppose towards a contradiction that Γ_{i+1} is not consistent
- There is $\{\gamma_1, \dots, \gamma_k\} \subseteq_{\text{fin}} \Gamma_i$ such that $\neg \forall x$. $[\alpha], \gamma_1, \dots, \gamma_k \vdash \alpha\{y/x\}$. Why?
- Since $y \notin fv(\Gamma_i) \cup vars(\varphi_i)$, we can use Universal Generalization to get $\neg \forall x. \ [\alpha], \gamma_1, \dots, \gamma_k \vdash \forall x. \ [\alpha].$
- One can avoid using $\neg \varphi$ as an assumption to prove φ for any φ . So $\gamma_1, ..., \gamma_k \vdash \forall x. [\alpha]$
- But this contradicts the fact that $\Gamma_i \cup \{\neg \forall x. [\alpha]\}$ is consistent!
- So Γ_{i+1} is consistent for every *i*.

- Γ_{ext} is consistent, since each finite subset of Γ_{ext} is also a finite subset of Γ_i for some $i \ge 0$. **Exercise:** Why only one Γ_i and not multiple?
- For every φ_ℓ such that Γ_{ext} ∪ {φ_ℓ} is consistent, Γ_ℓ ∪ φ_ℓ is also consistent (reasoning as above), so φ_ℓ ∈ Γ_{ℓ+1} ⊆ Γ_{ext}. Therefore, Γ_{ext} is maximally consistent.
- Consider φ_ℓ = ¬∀x. [α] ∈ Γ_{ext}. Note that Γ_ℓ ∪ {φ_ℓ} is consistent (as above). So ¬α{y/x} ∈ Γ_{ℓ+1} ⊆ Γ_{ext} for some *y*, by construction. Therefore, Γ_{ext} is also ∃-fulfilled.
- Thus, we have shown that every consistent set Γ can be extended to an ∃-fulfilled MCS Γ_{ext}.
